

Gegevens en beschrijving van collectie

Herbarium-#	4128
Leg.	E.R. Osieck
Species	?? <i>Teichospora</i> , cf. e.g. <i>Teichospora trubicola</i> with similar spores and variable papil length (but much shorter than in this collection)
References	Jaklitsch & Voglmayr 2016
Ass. taxa	<i>Nectria autrantiaca</i> , <i>Orbilina (cardui) comma</i> , <i>Protofenestella ulmi</i> en <i>Didymosphaeria massarioides</i>
Location	Nieuw-Wulven, north of Houten (Ut.), NETHERLANDS
Habitat	Woodland , recently planted (about 20 years ago) on clay soil
RD (Amf)	139-451
Collection date	25/07/2020
Host	<i>Ulmus</i> (dead branch on fallen but still living tree)
Description	Pseudothecia with long papil (0,8-1,1 mm) black. Asci (ca. 150 x 10 μ m), bitunicate, uniseriate, strikingly persistent, with short stipe (16-20 μ m). Pseudoparaphysen long and thread-like (\varnothing 2-3 μ m), non-septate? Spores (16,5-19 x 8,5-9 μ m), brownish, ellipsoid with obtuse ends, initially not constricted, with 3(4) wide transversal septa (thicker than the wall) and one longitudinal septum, often oblique in the middle cells (often lacking in end cells); mature spores constricted at all septa.
